2. For thermal pad, order part 'BCC THERM'.

## Application Notes

Current and voltage balance pins are used to connect units in parallel - see drawing. Remote On/Off: Output is on with pin left floating, pull pin down to -Output to turn output off.
Remote sense pins are used to compensate for lead drops, for up to 0.5 V maximum. When not used, move switch SW1 to local positions. See below for switch positions. The BCC series is approximately $80 \%$ efficient, so for 400 W load consumption, the cooling system used will have to be able to absorb 100 W while maintaining the baseplate to a maximum of $+83^{\circ} \mathrm{C}$.

## Examples of parallel operation

Ensure output power leads are of equal length and type for all units and that they are capable of carrying the load current. Set all units to the required output $\pm 0.1 \mathrm{~V}$. The voltage setting pot on unit 1 can be used to set the overall output voltage if required.
