# MELSEC QnA/A

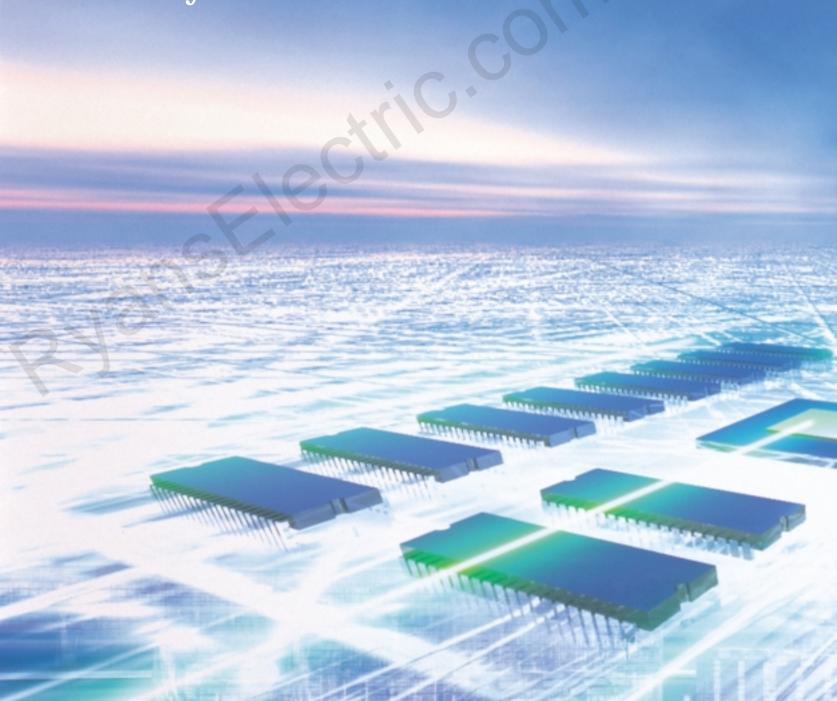

Mitsubishi Electric Corporation Nagoya Works is a factory certified for ISO14001 (standards for environmental management systems) and ISO9001 (standards for quality assurance management systems)

# Function, Performance, A superior combination for a su

Flexible network configurations, powerful programming tools, and a wide product range the QnA/A series the right choice for every level of factory automation.

# Flexibility: uperior product

## **QnA CPU Features**

#### ■ High speed processing

The requirement for faster processing speed of PLC systems will never end because faster processing means shorter production time, more precise control, and better quality in applications. MSP (Mitsubishi Sequence Processor) performance has been greatly improved compared to the types used in AnA/AnUCPU. QnACPUs gives roughly 3 times faster processing speed than AnUCPUs.

|               | Q4ARCPU<br>Q4ACPU | Q3ACPU | Q2ACPU (S1) |
|---------------|-------------------|--------|-------------|
| LD X (input)  | 0.075µs           | 0.15µs | 0.20µs      |
| OUT T (timer) | 0.60µs            | 1.20µs | 1.60µs      |
| MOV           | 0.225µs           | 0.45µs | 0.60µs      |
| +             | 0.90µs            | 1.80µs | 2.40µs      |

Note: Processing time varies depending on accessing device type.

Each CPU module is equipped with a large built-in memory in addition to approximately 30k words of internal device memory. With the largest memory available, the Q4A and Q4ARCPU can control up to a 124k step program.

#### Global and local devices

MELSEC-QnA offers a new concept in internal device memory. In support of the multiple programming features of QnA PLCs, each program module can be installed with its own internal memory bank, called a 'local device.' The data of the local device does not influence the results of other program modules, and conversely it is not affected by other modules either. Local devices, then, can be used freely within program modules. At the same time, global devices with a common memory shared by all the program modules are also available, and can be used for interlocking of program modules.

#### ■ Multiple programs

Up until now, PLC programs were generally composed of one long program which handled all tasks, but because of PLC's scanning operation and program size, programming and debugging was not easy. Even utilization of a previously made program for another control application was not easy to implement.

MELSEC QnA can handle and execute multiple program modules. At the program design stage, program modules can be created process by process, function by function (e.g. of a machine) or designer by designer for concurrent design. There are many advantages to this approach.

- Easier to understand because each program module can be made for specific functions and program modules are smaller than one long program.
- Program merging is not necessary after parallel design of program modules by multiple designers.
- Easier to make standardized program modules which can be used repeatedly for other similar projects.
- •Saves time for program up/down loading at debugging stage because of smaller program size.

#### ■ Q6MEM Series IC memory card

Q6MEM are PCMCIA compatible IC memory cards that can extend the data memory size of the CPU. There are a number of memory sizes and types that can be chosen based on application requirements. Up to 2MB per card is available in the following formats: SRAM memory only, SRAM+

EEPROM and Flash ROM+SRAM.

Although an IC memory card is optional, it is required if the following apply.

- •Sampling trace, Program trace, or Status latch function is used
- •More than 16 fault records are required
- Store device comment in CPU
- •File registers are required
- •Local device function is used
- Program-boot from IC card is required
- •Max. size of program (depending on CPU type) is created

#### Macro command

A ladder program block used frequently in a given program can be registered as a macro command and then utilized in any other program any number of times with different input and output devices. Use of this feature eliminates retyping of the same form of ladder block and helps standardize programming.

Pre-registered macro command libraries are also available. The macro library software SW\_IVD-MSPQ/MSDQ consists of the following macro commands:

The special function module library MSPQ comprises ladder program blocks necessary for MELSEC special function modules such as the RS232C interface module.

The standard ladder program library MSDQ comprises ladder blocks generally required for machine controls such as on-delay timers and emergency stop detection.

## **A CPU Features**

A2UCPU A2ACPU A2NCPU

A2UCPU-S1 A2ACPU-S1 A2NCPU-S1

A4UCPU A3UCPU A3ACPU A3NCPU

#### ■ Large memory/program capacity

The A Series enables choice of memory size by removable memory cassette construction so that users can find the most economical memory size. From the smallest 16k byte memory cassette, A3NMCA-2, to the largest 1M byte, A4UMCA-128, 9 different memory cassette sizes are available. In addition, three additional E²PROM type memory cassettes are provided for AnU users. Those memory cassette have EEPROM memory as non-volatile program storage in addition to the same size of SRAM memory.

#### ■ Large I/O control

With the highest specification model of AnN or AnA, up to 2048 I/O can be controlled. With AnU, a CPU can control 512/1024/2048/4096 I/O depending on the model. This number of I/O can be directly connected to the CPU rack, but all AnU CUP models have the capacity to control 8192 I/O. This is the total of the directly connected I/O plus I/O controlled through the remote I/O system of MELSECNET/10 or CC-Link.

#### Compatibility

Compatibility is maintained among the AnN, AnA and AnU CPUs. All I/O modules, power supply modules, mounting racks, special function modules are common to all these CPU models. Also, the sequence program is upwardly compatible from AnN to AnA to AnU. In addition, programs for A Series are also compatible with A2C and AnS compact PLC Series.

#### ■ Complete self-diagnostic functions

- •A watchdog timer (WDT) that can be set in 10 ms increments up to a maximum of 2 sec., this function monitors calculation congestion.
- CPU fault detection such as arithmetic circuit check and RAM memory check.
- Memory fault detection by command check and parameter check
- Automatic measurement of scan.
- Comment display of detected fault (A3N only).

#### Extended networking functions

All A Series PLCs support industry standard network systems such as Ethernet, PROFIBUS, MODBUS, and Mitsubishi's MELSECNET systems.

In addition, a newly developed 10M bps network, MELSECNET/10, has been added to the supported network line up. All A Series CPU modules are compatible with the MELSECNET/10 network and can exist in the same network segment. The combination of MELSECNET/10 and AnU offers maximum functionality and performance with a floating master function, increased 8k bits + 8k words of cyclically refreshed network device memory, 4 network segments per PLC and so on, in addition to conventionally available cable redundancy and network diagnostic monitoring.

The new open field network, CC-Link, is also supported by all the A Series PLCs.

#### Advanced RAS and debugging functions

Seventy-six diagnostic items are available. An error history log provides a list of the last 16 errors. Included is the time of error generation and details of which error occurred. CHK instructions identify the presence of user specified patterns at the PLC's inputs lines to identify faults in external circuits. Online sampling trace, status latch and device memory bus monitoring functions are also available. Each of these contributes to the AnA's highly advanced performance characteristics.

# **Q4ARCPU Redundancy**

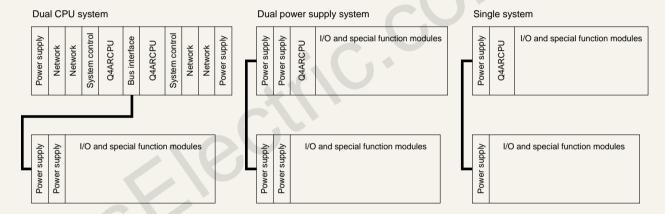

The Q4ARCPU system has been specially designed for process control applications that require redundancy of PLCs and extensive process control features. Using state-of-the-art QnA PLC technology as its base architecture, the Q4ARCPU has a number of added features.

Q4ARCPU system

#### Configurations

The most suitable basic configuration can be chosen from the three different configurations shown as follows. The dual system offers redundancy of power supply modules, CPU modules and network modules and includes extensive process control features. The dual power supply system provides redundancy of power supply modules only with the extensive process control features. The single system offers the process control features, but not redundancy.

#### Math-coprocessor

The Q4ARCPU is equipped with a math-coprocessor in addition to the dedicated ladder processor MSP. The math-coprocessor allows the Q4AR to make floating point mathematical calculations 10 to 100 times faster than other CPUs.

| Calculation | Q4ARCPU | Q4ACPU | A3ACPU |
|-------------|---------|--------|--------|
| +           | 35µs    | 238µs  | 476µs  |
| _           | 35µs    | 241µs  | 482µs  |
| ×           | 35µs    | 114µs  | 228µs  |
| ÷           | 38µs    | 373µs  | 746µs  |
| SIN         | 34µs    | 2310µs | 4620µs |
| COS         | 34µs    | 2460µs | 4920µs |
| TAN         | 37µs    | 2485µs | 4970µs |

#### On-line module change

Main rack: Modules on the main rack including all CPUs except A6RAF and the rack itself can be replaced during on-line operations by turning the power supply for the fault module off.

Local & remote I/O rack: Digital I/O modules and power supply modules on a local I/O rack can be replaced when operation is on-line. Use of a programming tool to designate the I/O module to be replaced is necessary in order to avoid taking the wrong input signal or giving a wrong output signal.

Note: Special function modules on local I/O racks cannot be replaced.

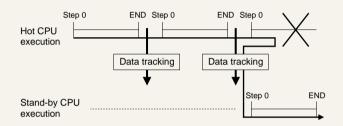

#### ■ Hot/Stand-by operation

The Q4ARCPU's dual CPU system provides hot/stand-by operations for PLCs. When the hot CPU is operating normally, all the I/O modules are controlled by the hot CPU. During that time, the stand-by CPU does not execute its program, but copies the internal device data of the hot CPU. If the operation of the hot CPU becomes abnormal, the stand-by CPU starts operations based on the most recent data it copied from the hot CPU and control of the system is resumed.

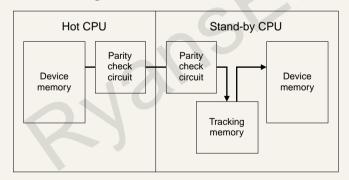

#### ■ Data tracking

the data and signal an alarm.

In order to resume operations either some or all of the internal device memory is copied to the stand-by CPU from the hot CPU, an operation called 'data tracking.' With data tracking, data of up to 48k words for a single scan and a greater amount for multiple scans is copied.

When switchover of the system occurs, the stand-by CPU resumes program execution based on the data from the most recent data tracking in order to ensure no data is lost. Because the reliability of tracked data is very important, the tracking circuitry has a parity check to ensure it. If any errors in the data are found, the stand-by CPU will reject

Note: Local devices cannot be assigned as tracking data. Note: The data tracking area must be set by the user.

#### ■ Program tracking

The programs in both CPUs have to be exactly the same, which means that when you first download a program it must be downloaded on both CPUs. Any revision, however, carried out to a program of the hot CPU during operation will be automatically copied to the stand-by CPU.

Note: Changes made to the stand-by CPU during operation will result in a stand-by CPU error, though the hot CPU will carry on in its operations despite it.

#### Control switchover

Control of the system will be switched over if any of the following errors is detected.

- AS92R detects any error related to the CPU, power supply, or to AS92R itself. (Refer to the items monitored by AS92R.)
- The network module is disconnected from MELSECNET/10 communications.
- The bus change request key switch located on A6RAF is activated.

If any of the above conditions, except for network module disconnection, is detected, the system will switch over within 300 msec. (The amount of time varies depending on the size of data tracking.) If a network disconnection is detected, system switchover will be complete within 3 sec.

#### Process control commands

In addition to the standard command set available in other QnACPUs, the Q4AR has 47 process control commands. The additional commands include various PID and PID related commands, compensation calculations, logical calculations, and comparisons. PID calculations are carried out with floating point values so the calculations are highly accurate.

These features make the Q4ARCPU compatible with process control applications.

## Restrictions on modules for use with the Q4AR system

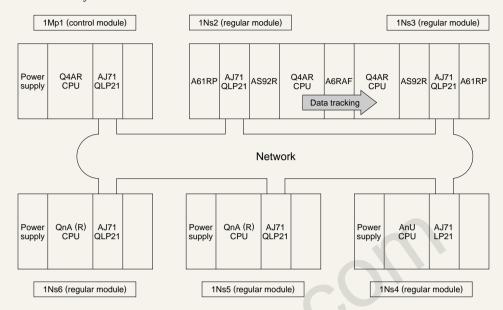

#### Prohibited from use:

| Floiibited from use.            |                         |  |  |  |
|---------------------------------|-------------------------|--|--|--|
| With single Q4AR system         | With dual Q4AR system   |  |  |  |
| AJ71C23                         | Modules listed left     |  |  |  |
| AD57-S2                         | AJ71AP21(-S3)           |  |  |  |
| AJ71C24 (S/W Ver. G or earlier) | AJ71AP21GE, AJ71AR21    |  |  |  |
|                                 | AJ71P25, AJ72R25        |  |  |  |

| AJ71LP21, AJ71BR11              | AJ71QL21 (S), AJ71BR11  |  |  |  |
| AJ72LP25, AJ72BR15              | (S/W Ver. G or earlier) |  |  |  |

## **Q4ARCPU Redundancy**

#### ■ Redundancy PC network system

• Existing PCs and Redundancy PCs can be combined on the same network.

#### **■ Compatible CPU modules**

All of the QnA family of CPU modules from QnAS\* to QnA to Q4AR can be used with this redundancy configuration. A smaller, low cost system can be configured for QnAS, and a larger system with QnA and Q4AR modules.

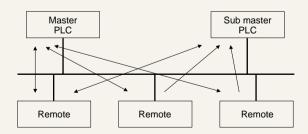

\*The QnAS CPU is a compact sized CPU from the QnA series. Please refer to the QnAS/AnS CPU catalog for more details.

#### Operations

CPU: While the master CPU is normal and controlling remote I/Os, the sub-master CPU is executing its program and receiving remote I/O data via the network. Both CPUs carry out their respective programs, but they are not synchronized.

Master network module: Network modules of both the master and the sub-master are active, but the sub-master does not send data out to control remote I/Os when the master CPU is in normal mode.

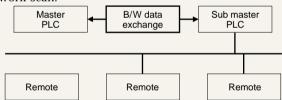

Local I/O: Local I/O modules can also be used, but they cannot be controlled by the CPU module on the other side.

#### **■** Exchange of data between CPUs

With this configuration each CPU runs its own programs. Whether the sub-master runs a program to resume control or not depends on the requirements of the application.

Each CPU, however, knows the status and controls the results of the other CPUs. A network device B/W can be used for data exchange between the CPUs. Up to 2k bytes of B/W can be sent from one CPU to the other every network scan.

#### ■ Control switchover

Control switchover occurs when any of the following is detected.

- •The power supply of the master PLC has gone down
- The QnACPU on the master detects a fatal error that makes it impossible for the CPU to continue operations.
- The network module on the master is cut off from communications

Note: The direction of switchover is always from the master to the sub-master. Once control is switched over from the master to the sub-master, the sub-master does not switch back over to the master even if an error is detected. When the master, then, is ready to be put back online, it is recommended that both PLCs be reset as soon as possible.

#### ■ Switchover time

Switchover time is as follows:

- In the case of a power, CPU, or network module failure, approximately 1 second is required to switch control.
- In the case of a network cable disconnection, approximately 3 seconds are necessary to switch control.

| Item                         | Specification  |
|------------------------------|--|
|                              | '  |
| Input voltage                | 100-120/200-240VAC +10/-15%  |
| Input frequency              | 50/60Hz +/-5%  |
| Max. input VA                | 110VA  |
| Inrush current               | 20A within 8ms   |
| Rated output                 | 5VDC 8A  |
| Over current protection      | Over 8.8A  |
| Over voltage protection      | 5.5 to 6.5VDC  |
| Efficiency                   | 65% or better  |

| Terminal screw size          | M4   |
| Applicable wire size         | 0.75 to 2 sq-mm  |
| Allowable power interruption | 20ms or less   |
| Withstand voltage            | 1500VAC 1min.  |
| External signal              | Power module abnormal signal<br>(Normally closed relay)<br>240VAC/24VDC 2A |

## ■ A61RP Power supply module

#### **Features**

●This control module monitors the power supply, the error status of the CPU, as well as its own error status. It sends error signals to the A6RAF and opens the corresponding relay output. It monitors the following:

CPU's self-diagnostic results CPU's operation AS92R's self-diagnostic 5VDC power voltage 24VDC power voltage Power supply failure signal

- Relays closed in normal conditions are provided to indicate errors to the external.
- •2 point inputs are provided for general use.

#### ■ AS92R System control module

#### **Features**

- A6RAF switches the path accessible to the CPU to the
- Bus switching is carried out when AS92R detects an error, or when the bus switching switch located on the A6RAF is triggered.
- A6RAF has a switch for selecting either Back-up mode or Separate mode.
- In the case both CPUs go down, there is a switch on A6RAF for selecting either Output hold mode or Reset mode
- With A6RAF, it is possible to select which CPU will be the Hot CPU in the case where power to both CPUs is turned on at the same time.

#### ■ A6RAF Bus Switching module

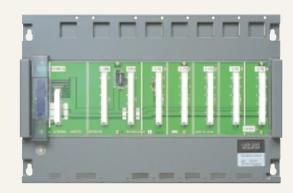

| Product                                    | Model  | Note                 |
|--|--------|----------------------|
| Redundancy Main Base                       | A32RB  | 2 One Side I/O Slots |
| Redundancy Main Base                       | A33RB  | 3 One Side I/O Slots |
| Power Supply Extension Base for Redundancy | A68RB  | 8 I/O Slots          |
| Power Supply Redundancy Base               | A37RHB | 7 I/O Slots          |

## **CPU Base Units and Cables**

#### **■ CPU base units**

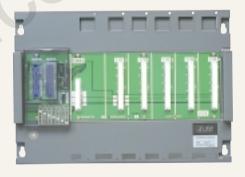

One CPU base unit is required for each AnU, AnA, AnN or QnA system. Each allows for one power supply module, one CPU module, and a maximum of either 2, 5 or 8 single slot size I/O modules. At either end of the base unit there is an expansion port for the connection of extension bases.

| Item                          | A32B-E  | A35B-E                            | A38B-E                              |
|-------------------------------|---|-----------------------------------|-------------------------------------|
| Maximum number of I/O modules | 2   | 5                                 | 8                                   |
| Extension base connection     | Not possible  | Possible                          | Possible                            |
| Installation hole size        | 6mm (0.24 inch) dia. per shaped hole (for M5 screw) |                                   |                                     |
| External dimensions mm (inch) | 247 (9.72) x 250 (9.84) x 29 (1.14)                 | 382(15.04) x 250(9.84) x 29(1.14) | 480 (18.9) x 250 (9.84) x 29 (1.14) |

#### Extension base units

There are two different types of extension base units. One which allows for a power supply module; the other, which does not. Selection of which type should be used depends on the total 5 VDC current demand made on the power supply in the CPU base unit. If this total demand is lower than the output of the one power supply, then an additional power supply is not required and the more economical extension base unit can be used. There are two extension ports at either end of the unit and connection to other base units is made via extension cables.

| Item                          | A65B  | A68B                                    | A55B                                    | A58B                                    |  |
|-------------------------------|---|---|---|---|--|

#### Extension cables

These extension cables are used to connect two base units together. There are three different lengths of cable available: as shown below.

| Item                | AC06B         | AC12B         | AC30B       |
|---------------------|---------------|---------------|-------------|
| Cable length m (ft) | 0.6m (1.97ft) | 1.2m (3.94ft) | 3m (9.84ft) |

# **Power Supplies and Memory Modules**

#### ■ Power supply modules

Each A Series system requires at least one power supply module inserted into the CPU base. Additional power supplies are necessary if A65B or A68B extension base units are used in the system configuration. The power supply requires an external power source of either 100/120VAC or 200/240VAC for A61P, A62P, A61PEU, A62PEU & A65P, 24VDC for A63P.

#### LVD compliant modules

From the 1st January 1997 the Low Voltage Directive (LVD) became mandatory within the EU. This directive is mainly concerned with the safety of electrical equipment operating above specified voltage levels. A61PEU, A62PEU and A63P have been newly developed to comply with relevant European safety standards EN61010-1 and EN61131-2 (applicable safety clauses only).

| Model number | Input voltage                    | Rated output             |  |
|--------------|----------------------------------|--------------------------|--|
| A61P         | 100 to 120 VAC or 200 to 240 VAC | 5VDC. 8A                 |  |
| A61PEU       | 100 to 120 VAC of 200 to 240 VAC | SVDC, 6A                 |  |
| A62P         | 100 to 120 VAC or 200 to 240 VAC | 5 VDC, 5A & 24 VDC, 0.8A |  |
| A62PEU       | 100 to 120 VAC of 200 to 240 VAC | 5 VDC, 5A & 24 VDC, 0.8A |  |
| A63P         | 24 VDC                           | 5 VDC, 8A                |  |
| A65P         | 100 to 120 VAC or 200 to 240 VAC | 5 VDC, 2A & 24 VDC, 1.5A |  |

#### ■ Memory modules & IC's

All AnU, AnA, AnN and QnA CPU's require the installation of a memory module or chip before they can be operational. The memory modules and IC's available for use are shown in the table below. Maximum memory and CPU modules to which they are applicable are indicated.

# **Input Modules**

# A complete range of input modules, suitable for all types of input devices.

There are over 16 different input modules available for use with the QnA and AnU, AnA, AnN Series, covering a wide range of voltages. From AC types to DC types, and even sensor input modules, you can choose the one which is correct for your application needs. They are available in 16, 32 or 64 point densities. All of them feature LED operation indicators and screen printed wiring diagrams on the front of the module. Modules fitted with terminal blocks can easily have them removed for ease of maintenance. Connector type models are simple to wire using standard type connectors.

# **Output Modules**

# A full line up of output modules for all your automation needs

With over 30 types to choose from, the range of output modules available for use with the QnA and AnU, AnA, AnN Series cover nearly every automation output device you will ever use. There are four different types of output modules within the range, relay, triac/SSR, transistor, and TTL output types. Each come in 16 or 32 output point densities. The transistor output type is also available with 64 points/module. Detachable terminal blocks or connectors are used for making wiring connections and maintenance easier, and each module has LED's for output status indication.

#### QnA and AnU, AnA, AnN output module specifications

| Part    | Output      | Number of Input  | Insulation        | Load            | Load    | Respo  | nse time       | Indication | Connection                         | Points/ | 5 VDC<br>current |                       |      |       |  |  |  |   |       |

# **Analog Modules**

## A68AD/A68AD-S2 Analog input modules

#### ■ Intelligent A/D conversion using built-in microprocessors

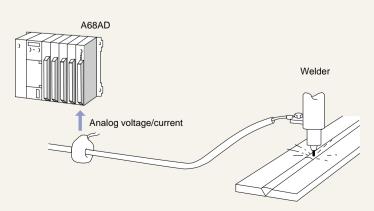

Analog input modules are available for all MELSEC QnA/A Series PLCs. Each is capable of accepting either current or voltage variable input signals. These signals are then converted in to a binary value by a built-in microprocessor, and can then be used for processing within the sequence

program. Input signals can be instantaneously read, or they can be sampled for user programmable time/count averaging processing. Setting offset and gain values for the converted values is also possible.

#### Analog input module specifications

| Part number                    | A68AD (-S2)   |  |  |  |
|--------------------------------|---|--|--|--|
| Applicable QnA/A Series PLC    | QnA/A Series  |  |  |  |
| Number of output channels      | 8 channels  |  |  |  |
| Analog output                  | Voltage: -10 to 0 to +10, input resistance 30k ohms<br>Current: +4 to +20 mA, input resistance 250 ohms |  |  |  |
| Digital input                  | -2048 to +2047  |  |  |  |
| Maximum resolution             | Voltage: 5 mV (1/2000), Current: 20 μA (1/1000)   |  |  |  |
| Overall accuracy               | ±1%   |  |  |  |
| Maximum conversion time        | 2.5 ms  |  |  |  |
| Absolute maximum analog output | Voltage: ±15 VDC Current: ±30 mA  |  |  |  |
| Insulation method              | Photocoupler insulation between input terminals and internal circuity  No insulation between channels   |  |  |  |
| I/O points required            | 32 points   |  |  |  |

Note: The A68AD-S2 type and log input module can be specially used to set a valid/invalid flag for the A/D transfer of each channel.

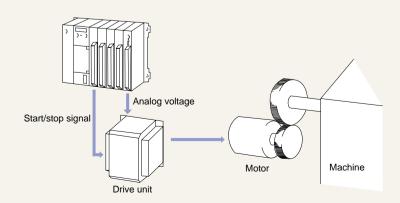

#### ■ Intelligent D/A conversion using built-in microprocessors

Analog output modules are available for all MELSEC QnA/A Series PLCs. Like the analog input modules each has a built-in microprocessor, which converts binary digital signals to

either current or voltage analog signals. Offset and gain values for the output signal can also be set and retained in the microprocessor.

#### Analog output modules specifications

| Part number                    | A62DA  |
|--------------------------------|--|
| Applicable QnA/A Series PLC    | QnA/A Series   |
| Number of output channels      | 2 channels   |
| Analog output                  | Voltage: -10 to 0 to +10, external load 500k - 1M ohms<br>Current: +4 to +20 mA, external load, 0 - 600 ohms |
| Digital input                  | ±2000 for voltage, ±1000 for voltage   |
| Maximum resolution             | Voltage: 5 mV (1/2000), Current: 20 μA (1/1000)  |
| Overall accuracy               | ±1%  |
| Maximum conversion time        | 16ms   |
| Absolute maximum analog output | Voltage: ±12 VDC, Current: 28 mA   |
| Insulation method              | Photocoupler insulation between input terminals and internal circuity<br>No insulation between channels      |
| External power supply          | 24VDC  |
| I/O points required            | 32 points  |

## **Analog Modules**

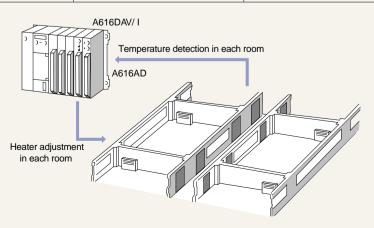

#### ■ High speed, high density analog modules for advanced applications

The A616 high density modules provide increased power and more flexible analog I/O capability. Both the analog input and output modules have sixteen channels per module; seven of which can be combined with multiplexer units. Utilizing these yields a maximum total of 121

channels per base module. The multiplexer units are available in three different types. One which provides isolated channels; another which gives non-isolated channels, and one which is for use with the thermocouple input module.

# A616TD, A68RD3/4 Thermocouple input modules

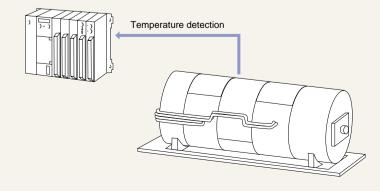

The A616TD and A68RD3/4 thermocouple input modules allow the direct connection of thermocouple devices to the PLC. Each of the modules convert the inputted signal from the thermocouple device into a digital value representing the detected temperature value. This detected temperature value can then be utilized within the PLC sequence program.

The A616TD thermocouple input module has the additional function of accepting other temperature sensing devices which produce an analog input. Connection with a multiplexing unit A60MX/MXT/MXR is also possible; providing up to 960 sensor inputs.

# **Positioning Modules**

#### AD75P1-S3, AD75P2-S3, AD75P3-S3 AD75M1, AD75M2, AD75M3 Positioning modules

The AD75 Series of modules represents the combination of Mitsubishi's technological expertise in the manufacture and design of CNC, Inverter, Servo and PLC systems. These modules provide a plethora of functions which satisfy the requirements of even the most demanding of positioning applications.

#### **■ Up to 3-axes operation**

The module controls up to three axis operations yet occupies only one slot size making it economical for motion control applications. Types of modules provided are:

1 axis - AD75P1-S3, AD75M1 2 axes - AD75P2-S3, AD75M2 3 axes - AD75P3-S3, AD75M3

#### Increased positioning data memory

Number of positioning data per axis is increased to 600 from 400 of AD71. In addition, the data is stored in flash ROM so that no battery is required.

#### S-curve acceleration/deceleration

The S-curve acceleration/deceleration function enables smoother start and stop, and reduces stress on machines. Up to 4 different acceleration and deceleration times can be defined, and used for each positioning operation.

#### Interpolation

Linear and circular interpolation can be operated with any combination of two axes.

#### Variety of original point return method

Six types of original point return methods are provided allowing greater flexibility of machine design and configuration. Automatic original point return function enables the machine to return to the original point from anywhere within the hardware stroke limit.

#### Positioning modules

#### Open-collector or differential driver

Either open-collector transistor or differential driver output can be selected to meet the motor amplifier's specifications. When using differential driver output, up to 400k pps can be transmitted as far as 30m (98.4 ft).

#### AD75TU, teaching unit

AD75TU, teaching unit is a handy programmer for AD75 Series modules. Monitoring of positioning status, JOG, teaching, test, and parameter and positioning data input can be carried out with this unit.

#### Extensive functions

AD75 has other very useful functions which include:

- •Unit selection of mm, inch, degree, or pulse
- Electronic gear
- Step operation/ Skip operation
- Teaching
- Override speed
- Velocity control

#### AD75M, SSC net compatible controller

SSC Net is Mitsubishi's Servo System Control network. With this network, MR-H-B, MR-J-B and MR-J2 servo amplifier are connected to a controller through the network system instead of pulse train or voltage signals.

SSC Net system gives the following advantages:

- Up to 30m (98.4 ft) distance between an AD75M and an amplifier
- Amplifier parameter can be down-loaded from AD75M
- •Amplifier's internal data can be monitored
- Possible to configure absolute systems

## **Positioning Modules**

#### **AD71**

#### Positioning modules; pulse train output

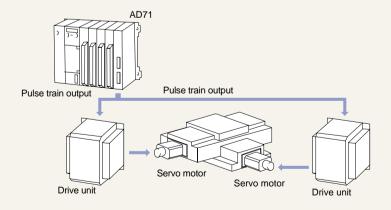

The AD71 is a pulse train output type positioning module with linear interpolation. It is suitable for use with both pulse and servo motors.

High speed positioning is attainable over a wide positioning range. In addition the positioning control unit can be set in accordance with the application; i.e. pulse, mm. inch, and degrees. Compensation functions are also available for improving positioning accuracy.

#### ■ AD71 specifications

| Part number                        | AD71                              |

## AD70, AD70D, AD72 Positioning modules

High speed positioning is attainable over a wide positioning range. In addition the positioning control unit can be set in accordance with the application; i.e. pulse, mm. inch, and degrees. Compensation functions are also available for improving positioning accuracy.

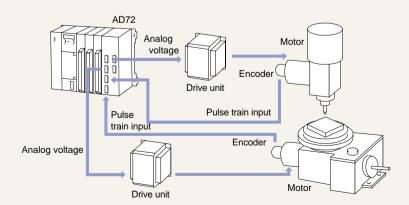

AD72 is a voltage output type positioning module. It can be used in conjunction with a servo motor for closed loop control precision positioning applications.

 $\rm AD70$  and  $\rm AD70D$  are single axis positioning control modules which can be connected to the MR-SB servo amplifier.

# **High Speed Counter Modules**

#### AD61 (S1)

#### High speed counter module

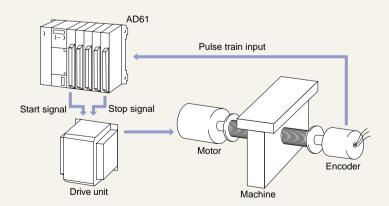

The high speed counter modules are designed to accept input pulses at frequencies up to 50 kHz. Count input pulses with rise and fall times of as little as 500  $\mu s$  can be counted. The modules have a wide counting range: from 0 to 16,777,215. The counter can be preset or disabled by external signals, as well as from the sequence program in the host PLC CPU.

Other features such as a ring counter function and external outputs are also available.

| Number of input channels    | 2 channels                                       |
| Count signal input          | 1 or 2 phase, 5/12/24 VDC, 2 to 5 mA             |
| Maximum counting speed      | AD61 50 kHz, AD61-S1 10 kHz                      |
| Count range                 | 0 to 16, 777, 215                                |
| Count type                  | UP/DOWN preset counter and ring counter function |
| External input              | 12/24 VDC 3/6 mA, 5 VDC 5 mA                     |
| External output             | Transistor (open collector) output 12.24VDC 5 mA |
| Current consumption         | 5 VDC consumption, 0.5A                          |
| I/O points required         | 32 points  |

## **Ultrasonic Linear Scale Interface Module**

#### ■ A64BTL ultrasonic linear scale interface

A64BTL is an interface module for connecting an ultrasonic linear scale manufactured by Balluf. Use of this linear scale gives the following advantages:

- Sealed construction so that it can be located in fluid.
- ●No accuracy degrading by friction

#### ■ A64BTL specifications

# **Intelligent Communication Module**

## AD51H-S3, High speed intelligent (BASIC) communication module

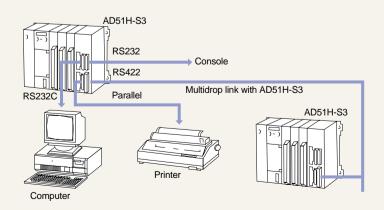

The AD51H-S3 is a high speed intelligent communications module capable of supporting up to four communications ports, 2  $\times$  RS232C, 1  $\times$  RS422, and 1  $\times$  parallel. It has an internal memory of 384k bytes for the storage of programs written in BASIC. These programs can be transferred to the module either by using an A6GPP/PHP or by using a VT220 compatible terminal.

Up to 8 BASIC programs can be executed concurrently and independently of the normal sequence program. Real time clock function and host processor interrupts are standard features providing user flexibility in creating data communication and collection capabilities.

#### **AD51H-S3 specifications**

| Part number                     | AD51H-S3   |  |  |  |
|---------------------------------|--|--|--|--|
| Applicable QnA Series PLC       | QnA/A Series   |  |  |  |

| Arithmetic and logic unit (ALU) | Performs high speed processing of BASIC's intrinsic functions such as trigonometric, inverse trigonometric, logarithm, exponential, square root, absolute value etc. |  |  |  |
| Clock element                   | Year, month, day, hour, minute, second   |  |  |  |
| Console                         | A6GPPE, A6PHPE, VT-220 terminal  |  |  |  |

## **Parallel Interface Module**

#### **AD59**

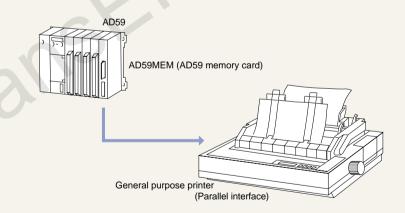

#### Parallel interface module

The AD59 parallel interface module allows the storing and printing out of large amounts of data. Data can be stored and accessed using the modules memory card interface, which allows a maximum of 32k bytes of data to be stored per memory card. This data can then be printed out via the modules built-in parallel interface.

#### ■ AD59 specifications

| Part number                   | AD59  |
|-------------------------------|---|
| Applicable QnA/A Series PLC   | QnA/A Series  |
| Number of I/O points required | 32  |
| Parallel interface            | Number of channels: 1<br>Standards: Centronic<br>FIFO memory capacity (1024 bytes)<br>Insulation: Photocoupler<br>Signal level: TTL level |

# **Interrupt Module**

#### ■ AI61, High speed interrupt input module

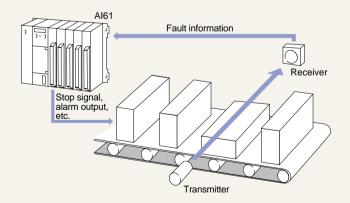

The AI61 is a high speed interrupt input module suitable for machine control applications which require rapid response times. When an interruption input signal is provided, the AI61 temporarily stops the normal sequence program from running and executes an interruption program according to the interruption vector. The interruption start condition may be selected by the use

The interruption start condition may be selected by the use of internal switches according to the type of equipment connected; i.e. interrupt may be started on the leading or trailing edge of the interrupt signal.

#### ■ AI61 specifications

| Part number                    | Al61                                      |
|--------------------------------|---|

| Rated input voltage            | 12/24 VDC                                 |
| Rated input current            | 6/14 mA                                   |
| Maximum simultaneous ON points | 100% simultaneous ON                      |
| Input resistance               | Approx. 24k ohms                          |
| Response time                  | OFF to ON & ON to OFF - 0.2 ms or shorter |
| Points per common              | 16  |
| I/O points required            | 32 points                                 |

# **System Monitor Modules**

#### ■ AS91 system monitor module

The AS91 is a system monitor module which is loaded in an I/O slot of an QnA/A Series base unit. These modules monitor the I/O bus by inserting a fixed sequence program in front of the user program to monitor specific Y outputs. When using these modules, outputs are possible from an I/O bus error contact, a RUN contact and general purpose contacts. A 5 VDC check is also performed.

#### **Further features include:**

Self test function: This function serves to check that the module itself is functioning normally with the CPU in the STOP status

Reset function: Allows an error output to be cleared (by pressing the reset push-button switch) when a bus fault occurs.

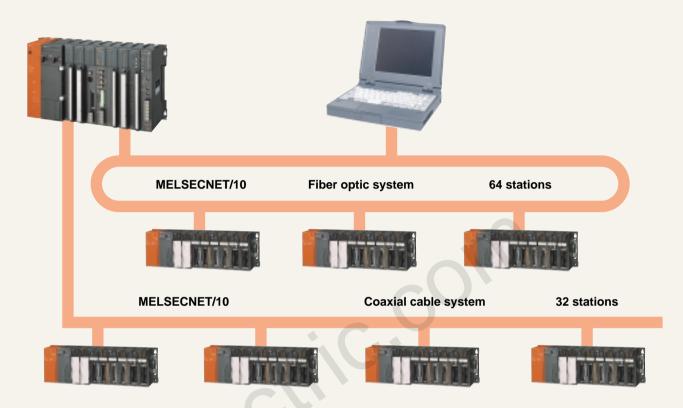

#### Specifications

## **MELSECNET/10**

## MELSECNET/10 is a high speed network system offering higher performance than the MELSECNET II network system.

#### ■ Up to 10/20M bps transmission speed

Computer supported flexible manufacturing requires more and more data flow on the factory floor. The high transmission rate can expand the number of transmission data while keeping through-put time from one PLC to another to a minimum. To achieve this aim, MELSECNET/10 has been developed to achieve 10M bps transmission rate, or 20M bps in dual transmission mode of dual loop system.

#### Fiber optic or coaxial cable

MELSECNET/10 offers fiber optic or coaxial cable networking. The fiber optic cable system has the advantage of no ambient noise and longer transmission distance. While the coaxial cable system has much lower cost of cabling.

#### High redundancy

Dual loop topology of the fiber optic cable system offers redundancy of cables. The system can continue to operate when a cable is accidentally disconnected or broken. In addition to cable redundancy, MELSECNET/10's token-pass communication method provides a floating master function. With this function, the network system can continue to operate using all connected PLCs, when a master PLC is shut-down.

#### Flexibility

Up to four MELSECNET/10 network modules can be installed in a single QnA or AnU PLC system with any mix of fiber optic or coaxial modules. Up to 255\* network segments can be connected as one large network system and any data can be transmitted To/From any PLC in any network.

#### Extended network devices

The concept of network global devices, B & W devices, available in MELSECNET II is also incorporated in MELSECNET/10. The number of B & W devices has been extended to 8192 of each. (B0 to B1FFF & W0 to W1FFF). One handy feature of this concept is that no special programming knowledge of network communication is required.

#### ■ PLC network or remote I/O network

MELSECNET/10 operates in either PLC-PLC network mode or remote I/O network mode. In PLC-PLC network mode, up to 64 PLCs in a dual loop system or up to 32 PLCs in a bus system can communicate with each other. In remote I/O network mode, up to 64 remote I/O stations in a dual loop system or up to 32 remote stations in a bus system can be controlled by one master PLC.

#### Diagnostic

Because network installation is often spread over a wide area, easy troubleshooting of the network is always an important factor when choosing a network type. Network monitor functions of the MELSECNET/10 system supply all the necessary information required for trouble shooting activities.

#### **■ Compatibility of CPU**

MELSECNET/10 allows any AnN, AnA, AnU or QnA to be connected to the system.

Note: A2ASCPU, A2U, A3U, A4U and QnACPUs are fully compatible with MELSECNET/10. All other CPUs have limited compatibility.

## **MELSECNET/10 for QnA**

## **MELSECNET/II•B**

#### MELSECNET II, MELSECNET/B

#### Choice of cable

The MELSECNET system offers a choice of four different varieties of cable. These range from the low cost twisted pair cable bus to dual coaxial cable to the highly reliable GI dual fiber optic cable network.

MELSECNET/B refers to the twisted pair cable bus system, while MELSECNET II to both coaxial and fiber optic systems. The software of both systems, however, provides the same range of functions.

#### ■ Loopback function (MELSECNET II only)

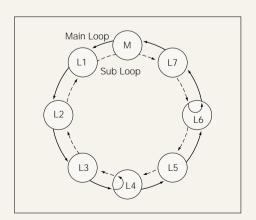

The MELSECNET II data link system uses two parallel cable loops for connecting PLC stations, a forward (main) loop and a reverse (sub) loop. In the event of a break in the main loop, communications will be automatically switched to the sub loop maintaining the data link system. If there is a break in both loops, communications will continue among the remaining connected stations as shown.

#### ■ Link up to 32 or 65 stations

In MELSECNET II system, one master and 64 slave stations can be connected per network. For MELSECNET/B, one master and 31 slave stations can be connected per network.

#### ■ High speed transmission

A coaxial or fiber optic cable system is capable of transmitting data at 1.25 M bps speed while the twisted pair cable system can transmit at 1 M bps maximum.

#### ■ AJ71AP21, AJ71AR21, AJ71AT21B MELSECNET interface module

The MELSECNET interface module allows the host PLC CPU to be connected on to the MELSECNET data link system. The module allows the PLC CPU to act as a master or local station on the network, as defined by the switch setting on the module. There are two interface modules, one for fiber optic cable networks and the other for coaxial cable networks.

A maximum of one module can be used per PLC CPU.

#### ■ AJ71AP21, AJ71AR21, AJ71AT21B specifications

#### ■ AJ72T25B MELSECNET/B remote I/O interface

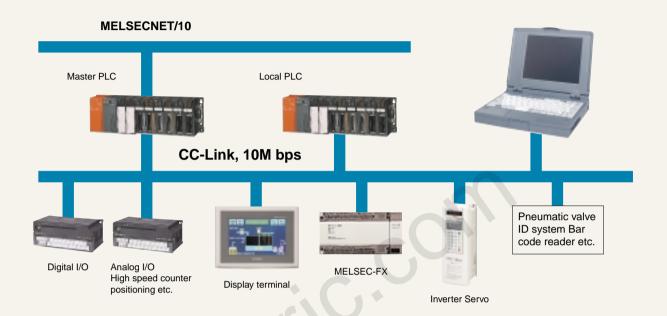

The module allows decentralized I/O control via the MELSECNET/B network. It can control up to 512 I/O points under a master PLC CPU.

#### ■ AJ72T25B specifications

| Connector type               | Terminal block        |
|------------------------------|-----------------------|
| Cable required               | Shielded twisted pair |
| Interface standard           | RS485                 |
| Maximum number of I/O points | 512                   |
| Current consumption (5VDC)   | 0.3A                  |

# **CC-Link**

■ Easy connection of bit level devices combined with advanced message and data transmission is now a reality with CC-Link, a field network system giving more sophisticated field information control while reducing cabling costs.

### Control & information

For CC-Link system, three types of remote devices are connected as follows:

**Remote I/O:** Field devices which only require ON/OFF control for their function such as digital I/O or pneumatic valves are specified as this type. Only bit data can be communicated with this device type.

**Remote Device:** Field devices which handle register values (numeric data) such as analog I/O and counters are specified as this type. In addition to bit data, register data can also be communicated.

**Intelligent Remote:** This is a device which is allowed to access the master and/or other stations actively for data acquisition and control. Local PLCs, GOTs and programming interface units are specified as this type.

### 10M bps high speed data transmission

CC-Link was developed not only for fast remote I/O control, but also for fast field information control. For this purpose, the transmission speed of CC-Link has been increased to 10Mbps compared to our previous field network system. This high speed performance allows communication of large volumes of data without affecting machine control speed.

### Personal computer connection

The A80BDE-J61BT13 computer board (PCI bus) operates as a local station within CC-Link. This PC board allows both monitoring and testing of CC-Link from a personal computer. Users can develop their own monitor or test software in Visual Basic Ver. 5.0 or Visual C++ Ver. 5.0.

### ■ Master/local configuration

Unlike other field networks, CC-Link can configure master-local configuration in addition to master-remote configuration. A local PLC can communicate with the master PLC and other remote stations.

### Multi-vendor connection

Many sensor and actuator vendors have joined the CC-Link partner program for direct connection of their devices with the network. Examples of devices are pneumatic valve, ID controller, bar code reader, robotics, display terminal, temperature controller and measurement sensors.

### ■ Hot/stand-by master configuration

A local PLC in CC-Link system can act as a stand-by master PLC for master PLC redundancy. Because of the increasing importance of filing data, such data should not be lost if the master shuts down. This function for CC-Link system gives a simple and inexpensive solution for redundant systems.

### On-line I/O replacement

2-piece terminal block construction of remote I/O allows on-line I/O replacement without affecting other remote I/O control.

### ■ Specifications: Network

| Item  | Specifications   |  |  |  |  |
|---|--|--|--|--|--|
| Transmission speed                            | 156k/625k/2.5M/5M/10M bps  |  |  |  |  |
| Maximum distance                              | 1200m (limited to 156kbps)   |  |  |  |  |
| Maximum number of connected stations          | 64 stations, however the following conditions apply:   |  |  |  |  |
| Maximum network data per network system       | Remote I/O (RX, RY): 2048 points Remote register (RWw): 256 points (master to local/remote) Remote register (RWr): 256 points (local/remote to master)                 |  |  |  |  |
| Maximum network data per local/remote station | Remote I/O (RX, RY): 32 points (30 points for local) Remote register (RWw): 4 points (master to local/remote) Remote register (RWr): 4 points (local/remote to master) |  |  |  |  |
| Communication method                          | Polling  |  |  |  |  |
| Synchronization method                        | Frame synchronization  |  |  |  |  |

Note: All the CC-Link modules are now compatible with CC-Link ver. 1.10 step by step. Modules compatible with CC-Link ver. 1.10 have on their side a "CC-Link" seal.

### **Digital I/O Modules**

- •Input, output or input/output combined modules
- ●16 pt terminal block, or 32 point high density connector
- •2-piece terminal construction for on-line I/O replacement
- ●1 common per 2 I/O points type available

### **Small Sized Digital I/O Modules**

- ●DIN Rail mountable
- •Can be horizontally or vertically mounted
- •Space saving small size
- One touch connector reduces wiring work

block

### AJ65BT-64AD, AJ65BT-64DAV AJ65BT-64DAI Analog I/O Modules

- ●12 bit resolution
- •A/D conversion or D/A conversion modules
- •4 channel per module

### AJ65BT-68TD, AJ65BT-64RD3 AJ65BT-64RD4 Thermocouple and RTD Modules

- Isolation between channels (TD only)
- ●Wire breakage detection
- •8 channel per module (TD only)
- •4 channel per module (RD only)

### ■ Specifications: Remote analog input, remote analog output

### AJ65SBT-64AD Analog to Digital Conversion Module

- Four analog input (voltage input/current input) channels are provided.
- Greater accuracy and higher resolution than the AJ65BT-64AD has been realized.
- Separate analog input ranges can be set for each channel.
- By incorporating a movement averaging process, the averaging process can be carried out without changing the conversion speed.
- •The installation area is 60% smaller and the volume is 38% smaller than the AJ65BT-64AD.

# COCC COCCCCC

### AJ65SBT-62DA Digital to Analog Conversion Module

- ●Two analog output (voltage output/current output) channels are provided.
- Greater accuracy and higher resolution than the AJ65BT-64DAV/DAI has been realized
- •Separate analog output ranges can be set for each channel.
- ●The installation area is 60% smaller and the volume is 38% smaller than the AJ65BT-64DAV/DAI.

### AJ65BT-D62, AJ65BT-D62D AJ65BT-D62D-S1 Remote High Speed Counter

- ●Up to 400kpps counting (differential type)
- •Two coincident outputs per channel
- Four special counting functions
  Ring counter, latch counter, periodic pulse counter, count disable

### AJ65BT-D75P2-S2 Remote Positioning Module

- •2 axes positioning control with linear or circular interpolation
- •Pulse train output for either stepper or servo amplifier
- •32 bit positioning range
- •Up to 1Mpps positioning speed (differential output type)
- Electronic gear function

### ■ Specifications: Remote high speed counter

### AJ65BT-R2 Remote RS232C Interface

Any RS232C equipped devices such as bar code reader or weighing meter, etc. can be connected to CC-Link through this RS232C interface module. Because of the high performance of CC-Link system, those RS232C devices can be located far away from PLC while retaining quick data access time.

### **AJ65BT-G4 Remote Programming Interface**

This is a programming interface that may be located anywhere in the CC-Link system. For adjustment or maintenance activities, a PLC can be accessed from anywhere in the network for up/down loading of program, monitoring, and some testing functions with GPP or MEDOC programming software. Furthermore, access is also given to other PLCs through CC-Link, QnACPU and MELSECNET/10.

### ■ Specifications: Remote RS232C interface

|                  | Model                | AJ65BT-R2                                   |  |  |  |  |
|------------------|----------------------|---|--|--|--|--|
|                  | Number of channels   | 1 channel                                   |  |  |  |  |
|                  | Communication method | Full duplex                                 |  |  |  |  |
|                  | Synchronization      | Asynchronous                                |  |  |  |  |
| DC222C interfere | Transmission speed   | 300/600/1200/2400/4800/9600/19200           |  |  |  |  |
| RS232C interface | Data format          | Start: 1, Data: 7/8, Parity: 0/1, Stop: 1/2 |  |  |  |  |
|                  | Error detection      | Parity check: None/Even/Odd                 |  |  |  |  |
|                  | Flow control         | DTR/DSR (ER/DR) or DC 1/DC 3                |  |  |  |  |
|                  | Cable distance       | 15m (49.21ft)                               |  |  |  |  |

### ■ Specifications: Remote programming interface

| Model                    | AJ65BT-G4  |
|--------------------------|--|
| Interface                | RS422, channel   |
| Function                 | Program up/down load, Program monitor, Device data up/down load, Device test   |
| Target PLC type          | MELSEC-A, AnS, QnA, Q2AS   |
| Accessible PLC location  | Master/local PLC on the same CC-Link PLC on MELSECNET/10 or MELSECNET II through master/local PLC on the same CC-Link Note: Access through MELSECNET/10 or MELSECNET II is available only when the target PLC is QnA/Q2AS. |
| Remote I/O type          | Intelligent device   |
| Occupied station numbers | 1 (RX/RY: 32 points each, RWr/RWw: 4 points each)  |

### Repeater modules for the CC-Link system

Repeater modules extend the total distance of the CC-link system and can realize T-break connections in it. The modules also simplify wiring in places where it is difficult to set cables.

### AJ65SBT-RPS/AJ65SBT-RPG module

- Extends the total distance up to 7.8km with a slower communication speed
- Realization of T-break connections possible

### AJ65SBT-RPT module

- Extends the total distance up to 13.2km with a slower communication speed
- Realization of T-break connections possible

### AJ65BT-RPI-10A/B module

- Realization of infrared ray transmission from 0m to 100m
- Capable of monitoring the status of transmissions between a Master station and remote I/O stations.

# **MELSECNET/MINI-S3**

### AJ71PT32-S3 /AJ71T32-S3 MELSECNET/MINI-S3 master module

The AJ71PT32-S3/AJ71T32-S3 MELSECNET/MINI-S3 master module allows the host QnA/A Series PLC to control up to 64 remote I/O stations connected on the MELSECNET/MINI-S3 networking system. The master module carries out high speed communication processing with the remote units connected to the network it controls. More than one master module can be used per PLC CPU, up to the maximum I/O points of the host CPU.

AJ71PT32-S3 is compatible with both fiber optic and twisted pair cable networks.

AJ71T32-S3 is compatible with twisted pair cable networks.

### A High Speed Remote I/O Networking System

### ■ Up to 512 remote I/O points

The MELSECNET/MINI-S3 remote I/O networking system allows a wide variety of remote I/O modules to be controlled by a central station. A maximum of 64 remote stations can be connected to one network loop, either using fiber optic and/or twisted pair cables. Up to 512 points of data can be refreshed between the master and remote stations in less than 3.2ms.

### ■ A Series inverters and FX Series PLCs

Both FREQROL A Series inverters and the FX Series PLCs can be connected to MELSECNET/MINI. Inverters can be controlled and monitored from the master station and the FX PLCs can exchange data with the master station.

### ■ RS232C interface unit

Communications with devices such as bar code readers and ID controllers is possible when connecting this unit to MELSECNET/MINI. Other general purpose devices can also communicate with this unit using a no protocol format.

### ■ AJ71PT32-S3/AJ71T32-S3 specifications

# **MELSECNET I/O LINK**

### I/O LINK

### High speed micro area distribution system

### ■ No additional program

MELSEC-I/O LINK doesn't require any additional knowledge of programming or network parameter configuration. It works just like a standard I/O module programmed with input (X) and output (Y), but actual I/O signals are distributed to remote I/O modules.

### ■ Up to 128 I/O distribution

MELSEC-I/O LINK can control up to 128 I/O points using 8 point input and output composite remote I/O modules, or up to 64 I/O points can be refreshed for remote I/O modules.

### ■ High speed I/O refresh

I/O refresh time of MELSEC-I/O LINK is minimized by high speed communication in order to minimize machine control delay. Max. 128 I/O points can be refreshed in approximately  $^{5.4}\,\mathrm{ms}$ 

### ■ Applicable cable

Connection by twisted pair cable gives the advantage of low cost in addition to easy wiring.

### **■** Flexible configuration

Numbers of I/O points of the remote I/O modules are kept small so that just the necessary number of I/O signals are distributed to locations where control devices are located. In addition, no terminal resistance requirement and the T shape branch feature give maximum flexibility of configuration and layout.

### ■ High reliability

Bus topology of MELSEC-I/O LINK gives the advantage of high reliability. Shutdown of one remote I/O module doesn't affect the communications of the others.

### ■ AJ51T64 master module specifications

| Number of maximum control I/O points | 128 I/O points using 8-point I/O combination modules,<br>64 points using any mix of I/O modules |
|--------------------------------------|---|
| I/O refresh time                     | Approx. 5.4msec   |
| External supply voltage              | 21.6 to 27.6VDC   |
| Transmission speed                   | 38.4k bps (actual 19.2k bps)  |
| Transmission path                    | Bus (multidrop) form, terminal resistor not required, T-shaped branch connection allowed        |
| Overall distance                     | Maximum 200m (656.2 ft)   |
| Maximum number of stations           | 16 stations per master  |
| Communication cable specification    | Twisted pair cable or cabtyre cable of minimum 0.5mm <sup>2</sup> thickness                     |
| Number of I/O points required        | 64  |
| Current consumption (5VDC)           | 115mA   |

# **QnA Series Ethernet Modules**

# Ethernet modules AJ71QE71, AJ71QE71-B5

### **Features**

- ●Operates on either of 10BASE5 or 10BASE2.
- ●TCP/IP, UDP/IP protocol support
- Selection of three communication modes
   Fixed buffer communication
   Random buffer communication
   PLC server function
- UDP/IP broadcasting
- ●PING function
- Connection through routers

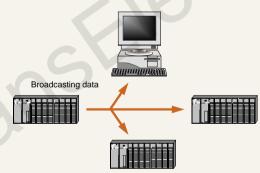

### Fixed buffer communication

AJ71QE71 has eight fixed buffer memories of 1k words each. With use of these memories, this module can send and receive up to 1016 word data per transmissions to/from other PLCs and/or other equipment.

### **■** Broadcasting function

AJ71QE71 can send up to 2046 bytes of data packet to all other nodes connected on the same Ethernet as an optional function of UDP/IP protocol. With use of this function, emergency information or network common information can be distributed in the network.

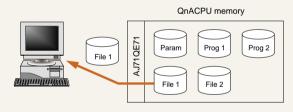

### **■ PING function**

AJ71QE71 can automatically confirm whether the connected node is still alive, by issuing a PING command so that the PLC can take recovery action in case the result of PING is negative.

### FTP server function

AJ71QE71 supports TCP/IP standard FTP (File Transfer Protocol) function. With this function, a PC can access QnACPU's program files, parameter file and other data files for up/down load.

# **A Series Ethernet Interface Modules**

### **AJ71E71-S3**

### **Ethernet module**

The AJ71E71-S3 is an ethernet network interface module which allows the host PLC CPU to be directly connected to an ethernet network system. It supports TCP/IP and UDP/IP protocols with the possibility of using either ethernet 10 BASE5 or 10 BASE2 simply by switch selection. The interface conforms with IEEE standard 802.3 (CSMA/CD) and features transmission speeds of up to 10M bps.

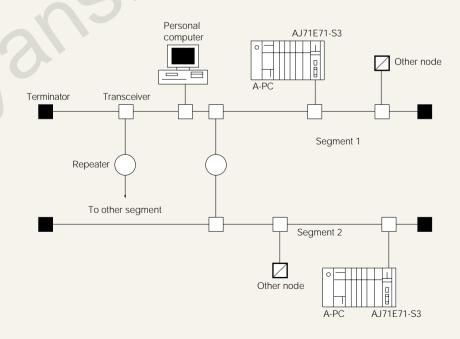

Device reading/writing, program uploading/downloading and remote run/stop controlling are all possible using dedicated instructions from any node on the ethernet system. Communications with other PLCs connected onto MELSECNET II and MELSECNET/10 is also possible.

### ■ AJ71E71 specifications

| Part number                   | AJ71E71-S3  |
|-------------------------------|---|
| Applicable QnA/A Series PLC   | QnA/A Series  |
| Number of I/O points required | 32  |
| Interface                     | Conforms to ethernet I/F (10 BASE5) and thin wire ethernet I/F (10 BASE2) |
| Buffer memory                 | Fixed buffer, 2k bytes × 8<br>Random buffer, 12k bytes                    |
| Transmission path             | Base band   |
| Communication speed           | 10M bps   |

### ■ System configuration example

# **QnA Series Communication Modules**

# Serial Communication modules AJ71QC24N, AJ71QC24N-R2, AJ71QC24N-R4

### **Features**

- A total of two channels of RS232C, RS422 and RS422/485 communication interface ports
- Both ports can operate as linked or independently.
- Choice of Dedicated protocol mode, Non-protocol mode, or Bi-directional protocol mode
- Entire QnA device memory area and program area can be accessed with the dedicated protocol mode.
- User definable frame is automatically added to transmission data.
- ●Up to 115.2k bps of high speed transmission.

### ■ ASCII/Binary code selection

In most cases, ASCII code is used for communicating with PCs, sensors, and serial printers. Included in AJ71QC24 modules, however, is the option to use binary code instead of ASCII for communication with PCs. Since a binary code data frame is half the size of an ASCII code data frame, data transmission time is cut in half.

**Transparency code:** When binary code is used for communication, a transparency code can be registered so that binary data having the same code as a frame termination code can be transmitted.

### ■ Independent/Link operation

Two communication port channels can operate either independently or linked.

**Independent operation:** Communication speed, data format, and protocol can be independently assigned to each channel for different applications.

**Linked operation:** In this mode, data received at Ch1 is retransmitted from Ch2 and data received at Ch2 is retransmitted from Ch1. This mode can be selected when multi-drop PLC control under one PC is required.

### Specifications

| It                    | em                      | AJ71QC24N  |                 | J71QC24N-R2     |                    |  |

# **A Series Communication Modules**

### **■** Special communication modules

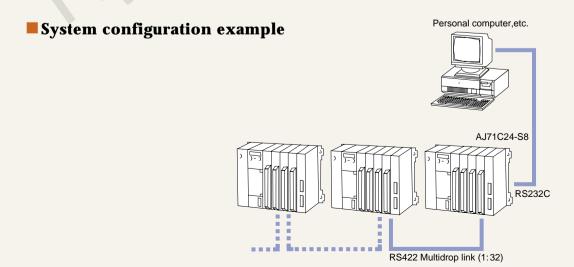

### A computer interface module for linking to computers and other intelligent devices

The AJ71UC24 computer interface modules allow external intelligent devices such as computers, to communicate with the PLC CPU. Sequence programs, bit devices, word devices, parameters etc. can be monitored or written to using serial communications which conform to RS232C and RS422 standards. Multi-drop systems can be configured

using these modules for linking up to 32 PLC stations and allowing access to all 32 from one centralized point. Each module can operate in either one of four fixed protocol communications modes or in no protocol mode. Each has its own built-in buffer memory for the reading and writing of data

### ■ AJ71UC24 computer interface module specifications

| Part number             | AJ71UC24   |  |  |  |  |
|-------------------------|--|--|--|--|--|
| Applicable A Series PLC | AnU, AnA and AnN Series  |  |  |  |  |
| Interface               | 1 x RS232C channel , 1 x RS422 channel   |  |  |  |  |
| Transmission system     | Half duplex communication system, dedicated protocol                                     |  |  |  |  |
| Synchronization method  | Asynchronous   |  |  |  |  |
| Transmission speed      | 300, 600, 1200, 2400, 4800, 9600, 19200 bps (switch selectable)                          |  |  |  |  |
| Data format             | 1 start bit, 7 or 8 data bits, 1 or none parity bit, 1 or 2 stop bit (switch selectable) |  |  |  |  |
| Access cycle            | Made at END of sequence program. Access time is equal to scan time                       |  |  |  |  |
| Error detection         | Parity check present odd/even or absent, sum check present or absent                     |  |  |  |  |
| ER/DR control           | Present  |  |  |  |  |
| DC1/DC3                 | Absent   |  |  |  |  |
| Transmission distance   | Up to 15m for RS232C, Up to 500m for RS422   |  |  |  |  |
| Transmission code       | ASCII  |  |  |  |  |
| I/O points required     | 32 points  |  |  |  |  |

# **PROFIBUS Interface Modules**

# ■ PROFIBUS DP/FMS, AJ71PB92D and AJ71PB96F

AJ71PB92D and AJ71PB96F modules allow connection to PROFIBUS DP and FMS network respectively. Now A Series PLC's can be used in conjunction with other PROFIBUS compatible equipment to provide a standard open network architecture while maintaining all the advantages and ease of use of the A Series.

### **■** Features

Conforms to DIN 19245

Utility software package (MELSEC ProfiMap\*)

AJ71PB96F modules have a number of special functions including domain control, PI control, PutOD, and FMA7 service.

- \*This software package contains the following features:
- Editor windows (fully supports Copy and Paste functions)
- Network parameter checking functions
- Download/Upload/Verify possibilities to the network modules
- Monitor windows
- ●Import/Export functions
- ●Parameter file handling on floppy disk/hard disk
- Parameter print feature

### ●Independent screen resolution

# **DEVICENET Interface Modules**

### **AJ71DN91 DeviceNet Master Module**

The AJ71DN91 module allows connection to a DeviceNet system. This unit functions as a DeviceNet master and can control up to 63 slave stations over a distance of up to 500m

- •Selectable communication speed
- Recognized open network standard
- •Wide range of DeviceNet compatible devices available

### ■ AJ71DN91 specifications

# **MODBUS Interface Modules**

### **AJ71UC24-S2**

### **MODBUS** interface modules

The AJ71UC24-S2 modules allow the QnA/A Series PLC to be connected to the MODBUS network. These modules under a MODBUS network system act as a slave station to write and read data to/from the ACPU memory in accordance with instructions given from a master system. In addition to the MODBUS protocol, these modules also support extended functions equivalent to the dedicated protocols of standard AJ71UC24 modules. This feature gives more flexibility of data acquisition and control by a master system.

- Support MODBUS slave station protocols.
- Function code 1 to 21 are supported
- ●Two transmission modes of RTU or ASCII

### Specifications

| Distance                      |   | to 15 m (49.2 ft)<br>o 500 m (1,640 ft) |  |  |  |
| Current consumption (DC5V)    | 0.1A                                    |   |  |  |  |
| Number of I/O points required | 3                                       | 32                                      |  |  |  |

### **■ Supported MODBUS functions**

| Function                            |
|-------------------------------------|
| Read coil status                    |
| Read holding register               |
| Reset single coil                   |
| Reset single register               |
| Read exception status               |
| Loopback test                       |
| Fetch event counter communication   |
| Fetch event communication event log |
| Force multiple coils                |
| Force multiple register             |
| Report slave ID                     |
| Read general reference-584 only     |
| Write general reference-584 only    |
|                                     |

### ■ Accessible device range

| MODBUS reference | Device      | Range         |  |  |
|------------------|-------------|---------------|--|--|
|                  | Υ           | Y0 to 1FFF    |  |  |
|                  | Х           | X0 to 1FFF    |  |  |
|                  | В           | B0 to B1FFF   |  |  |
|                  | M           | M0 to 8192    |  |  |
| Coil             | F           | F0 to 2047    |  |  |
|                  | T (Coil)    | T0 to 2047    |  |  |
|                  | T (Contact) | T0 to 2047    |  |  |
|                  | C (Coil)    | C0 to 1023    |  |  |
|                  | C (Contact) | C0 to 1023    |  |  |
|                  | Special M   | M9000 to 9255 |  |  |
|                  | D           | D0 to 8191    |  |  |
|                  | W           | W0 to 1FFF    |  |  |
| Holding register | R           | R0 to 8191    |  |  |
|                  | T (Value)   | T0 to 2047    |  |  |
|                  | C (Value)   | C0 to 1023    |  |  |
|                  | Special D   | D9000 to 9255 |  |  |

# **PC Option Boards**

### Overview

The A70BDE and A80BDE option boards are for use with an  ${\rm IBM}^{\circledast}{\rm AT}$  or 100% compatible computer. The option boards perform a variety of functions, including functioning as a CPU board (A80BDE-A2USH-S1) which performs the same role as an A2USH-S1 CPU, functioning as a network board (A70BDE-J71QLP23, etc.), which turns the computer into a regular station of MELSECNET/10, and functioning as a CC-Link board (A80BDE-J61BT11, etc.), which connects the computer to the CC-Link system. These option boards allow for the easy integration of PLCs and PC computers.

# **Programming Units**

### ■ A7PU handy programming units

The A7PU is a powerful, small programming device which can be used to compile, monitor and edit programs. It is a handy programming unit which can be used as either a hand held unit or as an interface unit for the programming of all the MELSEC A PLCs. It is capable of displaying two lines of program at a time and is connected to the PLC via an RS422 interface. When used in conjunction with an audio cassette, it can store and maintain programs and data.

### ■ A6WU EPROM writer

The A6WU EPROM writer is designed to be used with type 2764, 27128, and 27256 EPROMs. It has an LCD display, and can be operated easily using its dialogue mode. Its functions enable reading, writing, verify and erase checking of the EPROMs. It is connected to the PLC via an RS422 interface and can be hand held or clipped on to the PLC CPU's programming port.

### ■ A8PUE Peripheral Device

The A8PUE is a peripheral device that is used with the MELSEC-A series of general-purpose programmable controllers. It can read from and write to sequence programs in a MELSEC-A series PC CPU.

The A8PUE is also used for monitoring and testing devices. Follow the procedures in this manual when using the A7PUS to perform program I/O, as well as inspection and maintenance.

### ■ A8PUE specifications

| Item                               | Specifications  |
|------------------------------------|---|
| Connected module                   | ACPU  |
| Power, current consumption         | Power supplied from connected ACPU (5 VDC, 0.4 A)   |
| Connection method                  | Add-on (Attached directly to the ACPU)  |
| Connection method                  | Hand-held (Connected via RS-422 cable)  |
| LCD display                        | Display of 4 lines × 20 characters (with cursor)  |
| Operating method                   | Consists of 54 operation keys (covered with polyurethane film)  |
| Key operation check                | Buzzer  |
| Display lifespan                   | 100000 hours of more (when using the unit at 15 to 35°C ambient temperature and 65% RH or less ambient humidity)                            |
| Backlight lifespan                 | 50000 hours or more (when using the unit at 25°C operating ambient temperature) If ON, goes OFF if a key has not been input for 10 minutes. |
| Keypad lifespan                    | 1000000 times   |
| Outside dimensions H×W×D mm (inch) | 188 (7.40)×95 (3.74)×44.5 (1.75)<br>When installed onto an ACPU, the depth is 37.5 (1.48).  |

# **Modem Interface Modules**

### **Q6TEL**

### **Features**

- The QnA/A switch allows for connection to all QnA Series and A Series sequencer CPUs.
- Sequencer maintenance via remote access GPP peripheral devices such as DOS/V personal computers can be connected with the sequencer via a phone line allowing monitoring, testing, programming, and other revisions to be conducted at long distances. GPP peripheral devices such as DOS/V computers, and the sequencer when connected by RS-422 operate with the same GPP function.
- Notification System

When an abnormality occurs in the sequencer or trouble is detected at the operation facilities, notification and a message of up to 10 characters will be sent from Q6TEL to your pager.

- Password Registration
- When you register your password with Q6TEL, only authorized parties will be allowed remote access.
- RS-232C RS-422 Conversion Function

When Q6TEL is installed to the sequencer, peripheral devices can be connected with RS-232C (See Performance Specifications) cable making monitoring, testing, program scheduling and other changes to the GPP function possible. (An RS232C-RS422 Converter and conversion cable is not required.)

| Item                              | Specifi   | cations   |
|-----------------------------------|---|---|
| A/QnA conversion switch           | Set to "QnA"  | Set to "A"  |
| Applicable CPUs                   | All of the QnA Series   | All of the A Series   |
| CPU connection method             | Add-on method   | Add-on method for A2CCPU and A2CJCPU  |
| Connection cable                  |   | s Connection:<br>atible with AC30N2(A))   |
| Connection cable                  |   | onnection:<br>odem or specified cable   |
| Interface                         | RS232C (Modem or DOS/V c  | omputer used for connecting)  |
| Telephone circuit                 | Analog 2 line type, ISDN  |   |
| Number of notification items      | 10 items (Including Q6TEL transmission)                                 | 6 items (pager notification only)   |
| Pager notification message length | fixed or variable   | fixed   |
| Consumption current (DC5V)        | 0.15A (current  | from CPU unit)  |
| Outer dimensions                  | 102 (4.02) H× 109 (4.29) \  | $N \times 21(0.83)  D  \text{mm (inch)}$  |
| Weight                            | 0.2   | 0kg   |
| Software package                  | SW_D5C-GPPW<br>(: version 2 or higher)<br>Model GPP Software<br>Package | SW_D5C-GPPW (: version 3 or higher) Model GPP Software Package or SW2SRXV/NX/IVD-GPPA Model GPP Software Package plus SW2SRXV/NX/IVD-GPPATEL Model GPP Software Package |
|                                   | SW D5C-GPPW (: version 3 c  | or higher) Model Software Package   |

### Telephone Line Restrictions

Because data may be altered or the connection severed due to an incoming call alert signal, please refrain from using call waiting.

Because the connection may be severed when a receiver is picked up, avoid using lines to which multiple phones are connected.

### ■SW D5C-GPPW

### ( : version 3 or higher) model

|   | Item                          | Function   |
|---|-------------------------------|--|
|   | Circuit connection            | Connect via a telephone circuit to the location you designate.   |
| 1 | Circuit disconnection         | Disconnect the circuit   |
|   | Telephone number registration | Set the location and telephone number for the connection being made. A maximum of 250 circuits can be used.          |
|   | System settings               | Set the modem used to make the connection and the location where log files are to be housed.                         |
|   | Send and receive files        | Send and Receive files between GPP peripheral devices such as DOS/V computers. *Not supported by the Q6TEL function. |
|   | Prepare data for Q6TEL        | Configure the connecting modem, password, and notifications registered with Q6TEL and register with A6TEL.           |

### Additional modem information

Modem Specifications

Transmission Standards: Transmission speed depends on the modem

Error Detection: MNP Class 4/10 or V.42

Data Compression: MNP Class 5 or ITU-T V.42bis

NCU Type: AT Command

Both DIP switch and AT command (for use with terminal software) can be used to independently change the DR signal to H status.

Connection Cable

RS-232C cable included with the modem or specified cable can be used. (See Performance Specifications)

- ●Q6TEL: 25 pins; D sub-connector
- Personal Computer: 9 pins; D sub-connector
- •When Using a Cell Phone

When the recipient is using a cell phone the error detection function requires an MNP Class 10 Support Modem. It may not function properly when the line quality is poor.

If when using a cell phone, messages are set to be received automatically, use a transmission unit for cell phones that can manage such a function.

# **Programming Software**

# GX Developer (SW\_D5C-GPPW-E) MELSEC Programming software

GX Developer is a powerful Windows based programming software which replaces the previous DOS version MELSEC MEDOC, GPPA and GPPQ software packages. However, GX Developer is more than just an upgrade. By taking full advantage of the Windows environment and adding many useful functions, the GX Developer programming environ-

### ■ Programming languages

In addition to ladder and list programming languages, SFC (MELSAP2/MELSAP3) is supported. With the Windows environment, all these program types can be created and edited easily with the mouse or keyboard.

### ■ Easy program creation and editing

GX Developer supports standard cut, copy and paste operations. This allows greater ease of use and the ability to edit data in other applications. For instance, comment data can be edited in Word or Excel and directly pasted into the comment edit screen.

### ■ Full diagnostic capability

In the event of an operation error online diagnostics can quickly pin-point the problem. The GX Developer helpfile further assists to resolve hardware and software problems without the need for a manual.

### **■ CC-Link support**

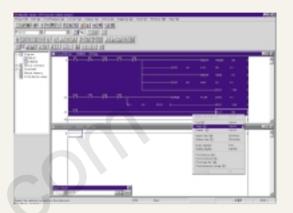

Operation monitoring, link status and testing have been enabled with the A/QnA Series. The CC-Link unit's link status and error status can be monitored with the A Series/QnA Series, and a line test to check for faulty stations can be carried out. Also, the CC-Link personal computer interface board (A80BDE-J61BT13) is also compatible with GX Developer.

### ■ Backward compatibility

GX Developer not only supports downloading existing projects from the PLC CPU but also allows direct conversion of existing DOS based software GPPA, GPPQ and MELSEC MEDOC FXGP (Win) and FXGP (DOS) data.

ment is easy to use and new program development is both fast and efficient.

GX Developer supports programming of all current MELSEC PLC CPUs, so project design using a variety of CPU types and series is possible.

### ■ Multi-windows, Multi sessions

Use of both multiple windows (e.g. different programs within the same project) and multiple sessions (e.g. more than one iteration of GX Developer running on a single PC) gives greater scope to share common data between program and projects quickly and easily. Also programming productivity is enhanced with this function. For example, a programmer can monitor one project while editing another.

### **■ Modem function**

Communication is possible via the A6TEL modem interface unit (A Series only) or the Q6TEL modem interface unit (A Series/QnA Series). By using a modem, remote PLCs can be serviced.

### **■** Software family

While GX Developer can be used by itself to create and manage programs and projects, other software packages have been produced to work in conjunction with GX Developer, further enhancing programming and maintainability.

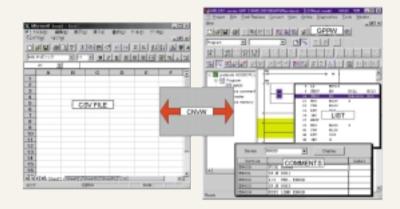

# GX Simulator (SW\_D5C-LLT-E) MELSEC Simulation software

Programs can now be tested and checked without the need to download to a CPU. This useful function allows simulation of the sequence program within the Windows environment. Program execution and timing can be easily seen and because the display method is the same as the standard monitoring function in GX Developer, the display format is both familiar and easy to understand.

A timing chart can be displayed with the ladder logic test tool function software package allowing program operation to be confirmed graphically.

# GX Converter (SW\\_D5C-CNVW-E) MELSEC Data conversion software

With this data conversion software package, comments created in CSV format (Text data/Excel data (CSV format data) compatible), etc., can be used. By using this data conversion software package, the command lists from the "read/write of other formats" menu can be used for device comment data. Furthermore, the GX Developer command lists and device comments can be converted and used in the list created by the user.

# MX Links (SW\_D5C-CSKP-E) Basic communication support tool

Communication with the PLC CPU via a variety of connection methods is supported with the MX Links software tool. PLC data can be collected via RS-232C, RS-422, Ethernet, MELSECNET/10 or CC-Link and used within a personal computer by other applications (e.g. Visual Basic V4.0/5.0/6.0, Visual C++ V4.2/5.0/6.0). A special library of commands, known as the MELSEC data link library, are available to allow the following functions:

| Function name | Function   |
|---------------|--|
| mdOpen        | Initialize and open the selected communication line channel                  |
| mdClose       | Close the selected communication line channel                                |
| mdSend        | Write the designed No. of bytes to the head of the device in a batch         |
| mdReceive     | Read the designated No. of bytes from the head of the device in a batch      |
| mdRandR       | Read the randomly designed device  |
| mdRandW       | Write the randomly designed device   |
| mdDevSet      | Set (turn ON) the designated device  |
| mdDevRst      | Reset (turn OFF) the designed device   |
| mdInit        | Refresh the PLC information when the PLC parameters, etc., have been changed |
| mdControl     | Carry out remote RUN/STOP/PAUSE of the designated PLC CPU                    |
| mdTypeRead    | Read the designated PLC CPU type   |

# MX Monitor (SW\\_D5C-XMOP-E) Monitoring tool

Visual Basic support is further enhanced with the MX Monitor monitoring tool. Acting as a custom tool within Visual Basic, (V4.0/5.0/6.0) it is easy to create monitoring screens that will reflect changes of status and data within the connected PLC. Functions such as figure display, value display, level display and trend graph are provided among 23 types of custom controls. A graphical monitoring application can be created just by pasting the MX Monitor controls into a VB form and setting the properties.

### MX Chart (SW□D5C-OLEX-E) Excel communication support tool

The MX Chart software tool allows PLC data and Microsoft Excel 95 Ver. 7 or Excel 97 data to be exchanged with no extra PLC programming required. The functions of this software tool are accessed as Excel macros. These macros can be invoked to allow Excel to read from or write to the PLC CPU.

### [Operating Environment for GX Developer, GX Simulator, MX Links, MX Chart and MX Monitor]

| OS              | MS-Windows 95 (English version) MS-Windows 98 (English version) MS-Windows NT Workstation 4.0 (English version) |
|-----------------|---|
| CPU             | Pentium 133MHz or more is recommend   |
| Memory          | 32MB or more is recommended   |
| Hard disk space | 50MB or more  |
| Disk drive      | 3.5-inch (1.44MB) floppy disk drive required CD-ROM disk drive  |
| Display         | Resolution 800×600 pixels or more   |

### **Programming Software**

### ■ MELSEC MEDOC plus, IEC compatible programming software

MELSEC MEDOC plus is the programming software for all MELSEC series PLCs. This software has been developed to improve productivity of programming by incorporation of IEC61131 standards.

The requirements to PLC controlled machinery and equipment are becoming more sophisticated. Also, PLC programs are becoming larger and more complicated. This results in a longer time required for PLC programming. In addition, large programs are not only a problem for designers, but also for maintenance people. They have to read and understand large PLC programs. Everybody wants to reduce programming time, and split large programs into several modules for easy understanding.

This software, compliant with the IEC61131 standard, provides an environment of structured programming. This allows large programs consisting of several programming modules to be constructed. In addition, compatibility with Windows provides a user friendly environment.

### ■ IEC61131 compatible

MELSEC MEDOC plus is compatible with the programming methods stated in IEC61131 standards. Functions such as programming language, ladder, instruction list, function block diagram, user defined function, and sequential flow chart are all provided. Because this software is designed to comply with pre-defined standards and programming principles, even users who are not familiar with MELSEC programming and language can use this software with a minimum amount of PLC hardware knowledge.

### ■ Structured programming

Sequential flow chart and task constructions of the software allow a large program consisting of multiple program modules based on each machine operation. Since each program module is fairly small, they are easier to understand and debug than if the entire program had to be dealt with.

### **■ Compatible CPUs**

MELSEC MEDOC plus is compatible with the following MELSEC Series PLCs.

FX<sub>0</sub>/FX<sub>0</sub>N/FX/FX<sub>2</sub>C/FXU/FX<sub>0</sub>S/FX<sub>2</sub>NC/FX<sub>2</sub>N A1S(S1)/A2S(S1)/A1SH/A1SJH/A2SH(S1) A2AS(S1)/A2US(S1/S30/S60)/A2A(S1)/A3A A2U(S1)/A3U/A1N/A2N/A3N/A2C Q2A(S1)/Q2AS(S1)/Q3A/Q4A/Q4AR Includes QnA(S)CPU H-types.

# 

### ■ Program library

Once a program module is created for a project, the module can be stored in a library. When a projects similar to one created previously, pre-made program blocks can be reused. This feature not only reduces program development time, but also reduces programming errors and debugging because proven modules are used.

### ■ Password protection

Multiple levels of passwords can be registered in a program providing protection from tampering.

### **■ MELSEC** compatible mode

For users who are familiar with MELSEC programming and want to continue this programming method, the software offers a MELSEC compatible mode. With this mode, the users can write a program with the MELSEC instruction set.

### **■** Hardware requirements

| OS        | Windows 3.1   | Windows 95/98    | WindowsNT        |  |
|-----------|---|------------------|------------------|--|
| CPU       | 386DX or high (Recommended Pentiu                                   | m or higher)     |                  |  |
| Memory    | 4MB (Recommended 16MB)  | Recommended 32MB | Recommended 64MB |  |
| Hard Disk | 20MB free   | 40MB free        | 40MB free        |  |
| Monitor   | VGA compatible graphics adapter (Recommended: 1024×768, 256 colors) |                  |                  |  |
| Other     | Mouse, Serial port ×1, printer port and printer, CD-ROM drive       |                  |                  |  |

# **Human Machine Interface**

### ■ GOT-900 series common features

- High speed response
  - GOT can be directly connected to the base of Mitsubishi PLC's base which keeps transmission at very high speeds. (It can also be connected to the base of the PLCs of some other manufacturers.)
- Editing, debugging and maintenance
  - Change sequence program at list mode
  - System monitoring
  - Network monitoring
  - Operating check of intelligent modules
  - Monitor and change devices and counters

- OS can be installed into GOT from a computer making it easy to upgrade versions and performance.
- •Simulation function

Through utilizing GT works, simulation from design graphics to debugging in a computer has been made possible.

### A985GOT

### A975GOT

### A956WGOT

### **■** Features

- Connection to 4 videos and the simultaneous display of 4 pictures is possible.
- With clip mode, it is possible to display only the desired portions of a particular graphic.
- 720×480 dots wide show
- Changeable window size
- Highlights 256 colors
- Superior maintenance function
- Compact size
- Voice output function
- Larger amounts of data can be displayed thanks to the extra wide window (1.5 times larger than the 6 inch type in width).
- Highlights 255 colors
- System monitor
- Equipped with a compact flash card interface for large data storage Available soon
